

# Definition of Continuity.

## 1. Definition

1) Let  $a \in \mathbb{R}$ .

Let  $f$  be a function defined, at least, on an interval centered at  $a$ .

We say that  $f$  is continuous at  $a$  when

$$\lim_{x \rightarrow a} f(x) = f(a)$$

replace from  $L$   
↓

(equivalent)

$$= \forall \varepsilon > 0, \exists \delta > 0, \text{ s.t. } |x - a| < \delta \Rightarrow |f(x) - f(a)| < \varepsilon.$$

(In the normal definition of limit when can exclude  $x$  from being exactly  $a$ , because what we need is to let  $x$  approach  $a$ . However, at here, we need  $x$  to be  $a$ , so we can simply don't restrict  $|x - a| > 0$ ).

## 2. Difference from limit.

1)  $\lim_{x \rightarrow a} f(x) = L$  means:

$$\left\{ \begin{array}{l} x \text{ close to } a \\ x \neq a \end{array} \right\} \Rightarrow f(x) \text{ close to } L.$$

2)  $f$  continuous at  $a$  means:

$$x \text{ close to } a \Rightarrow f(x) \text{ close to } f(a).$$

## 3. Continuity in conditions

1) Continuous at a point.

$$f \text{ continuous at } c \text{ means } \lim_{x \rightarrow c} f(x) = f(c).$$

2) Continuous on an open interval.

$$f \text{ continuous on the interval } (a, b) \text{ means:}$$

$\forall c \in (a, b), f$  is continuous at  $c$ .

3) Continuous on a closed interval

$f$  continuous on the interval  $[a, b]$  means:

①  $\lim_{x \rightarrow a^+} f(x) = f(a)$ .

②  $\forall c \in (a, b), f$  is continuous at  $c$ .

③  $\lim_{x \rightarrow b^-} f(x) = f(b)$

e.g.  $\uparrow$  y

4) Just 'continuous':

$f$  is continuous means:

$f$  is continuous on its domain.

e.g.  $\uparrow$  y

This function is continuous (on its domain) but

$y = f(x)$ . not continuous at 1.
